Disclosure, Page 115, 127pp, English. enzyme

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCB oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasta. The SCCE oligonucleoride may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is

The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating an enoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or pancreatic cancer, and other cancers in which SCCE is overexpressed. The peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:31.

                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                  The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in the individual A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or a trisk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunocherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                                    Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:109.
                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                             against stratum corneum chymotry incurvant (SCCE), comprising inculating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                  The invention relates to a novel method for vaccinating an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human; NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antipaemic; gene therapy; human disease; metabolic disorder; diabetes; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.

The present live and describes Nova procesus, where A can be a two so described above and a carrier; (2) a kit comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NoVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically by binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for determining the presence of or predisposition to a disease associated with altered levels of expression of the above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or above; (10) a method for identifying a potential therapeutic agent for comparing for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or predisposition to a pathology associated with the above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, and manual; and (14) a method for producing the above polypeptide in a seful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic card molecule may be used to diagnose, treat or prevent metabolic card molecule may be used to diagnose, treat or prevent metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abstract expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides. For example, NOVX polypeptides and cour polymucleotides may be used to treat disorders associated with decreased expression or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymetric assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may also be used as anti-low modulate NOVX polypeptide antibodies and antagonists and polymucleotide expression and activity of NOVX polypeptides antibodies may be used in this way to prevent, diagnose and treat: metabolic disorders, immune disorders, disorders, and the various dyslipidaemias, metabolic disorders, metabolic syndrome X and the various dyslipidaemias, metabolic disorders, metabolic syndrome X and the various dyslipidaemias, metabolic metabolic syndrome X and the various dyslipidaemias, metabolic metabolic metabolic syndrome X and the various dyslipidaemias, metabolic met

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cuplypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders cupolypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations creponable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to extracellular serine protease termed tumour antigen derived gene-14 (TADG-14) and its nucleic acid. Composition comprising TADG-14 peptide is useful for treating a neoplastic state in an individual. The neoplastic state is chosen from ovarian cancer, colon cancer, prostate cancer in which TADG-14 is overexpressed. The present sequence is Stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated DNA encoding tumor antigen derived gene-14 protein, useful for treating neoplastic state (such as ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer) in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunomodulator, cytostatic, nootropic, neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dendritic cells directed toward extracellular serine protease termed tumour antigen derived gene-14 (TADG-14). The method of the invention involves exposing the immune cells to a TADG-14 protein fragment, where exposure to the TADG-14 protein fragment activates the immune cells. The invention is used for the production of activated immune T cells or dendritic cells. The invention allows screening to identify proteases overexpressed in carcinoma. The present sequence is stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Production of activated immune cells or dendritic cells by exposing immune cells to tumor antigen derived gene protein fragment consisting of amino acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or

Claim 1; Page 171; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
comprising the nucleic acid molecule described above; (5) a cell.

comprising the nucleic acid molecule described above; (5) a cell.

comprising the nucleic acid molecule described above; (6) an entitody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
comprising a nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
ca berrant physiological interactions of the polypeptide; (11) a method of
acceptance or amount of activity or of latency or predisposition to
aberrant physiological interactions of the polypeptide; (11) a method of
creening for a modulator of activity or of latency or predisposition to
compression or preventing a pathology associated with the above polypeptide in a
consecutor, cytostatic, antibacterial, virucide,
consecutors have antidiabetic, anorectic, antibacterial, virucide,
consecutors have antidiabetic, anorectic, antibacterial, The
consecutor and antilipaemic activities, and can be used in gene therapy. The

polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to disquose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the
                                                                                                                                                                                          Gaps

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the abberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides associated with decreased expression or activity of NOVX by supplementing the patient our production or to recrify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX colymetric and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of calmilar sequences in samples, and so which patients may be in need of calmilar sequences in samples, and so which patients may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as used as antibopypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymucleotides may be used in this way to prevent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM, Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E, Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenborg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; Eisen A, Gangolli EA, Rieger DK, Spaderna SK;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes NOVX proteins, where X can be 1 to 55 C (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more described above; and a carrier; (3) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or presence or amount of the above polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above a polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method of identifying a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator or factivity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulation or reventing a pathology associated with the above polypeptide in a sectivity or of latency or predisposition to corpression or a pathology associated with the above polypeptide or mammal; and (14) a method for producing the above polypeptide or section of a pathology associated with the above polypeptide or section of a pathology associated with the above polypeptide or section of sections or an anitial and (14) a method for producing the above polypeptide or section of a pathology associated with the above polypeptide or section of a pathology associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or pathology and disperse such as disperse or

```

Human NOV18g protein SEQ ID NO:104

```
The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abserrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and corpleted to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the colls own genes and preventing their expression. NOVX polypeptic and complementary sequences may also be used as DNA probbe in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The entil of antibodies, agonists and antagonists may also be used as anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as diagnostic agonists and polymucleotide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, anorexia, cancer, cancer-associated achexia, neurodegenerative disorders, alzheimer's Disease, Parkinson's Dispersion and the warious dislibutions and the disorders, and the various dislibutions and activity of NOVX character associated achexia, neurodegenerative haematopoletic disorders, and the various dislibutions and activity of an anti-NOVX character associated achexia, neurodegenerative themselved and the activity of an a
                                                                                                                                                                                                                                                              Smithson G, Millet I, Peyman JA, ARALLETTON MALYANKAL ...,

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabbetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector

comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or above; (10) a method for identifying of the polypeptide; (11) a method of sociated with the polypeptide; (12) a method of a pathology associated with the polypeptide; (12) a method for modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (13) methods of treating or pathology associated with the polypeptide; (12) a method for modulating the above polypeptide; Novx cor preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a crivity of the polypeptide, and can be used in gene therapy. The squances have antidiabetic, anorcotic, antibacterial, virucide, immunomodulator, cytostatic, nortropic, neuroprotective, antiparkinsonian complexity and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or prevent metabolic cor disease, immune disorders such as diabetes or obesity, infections, cancer, neurodegenerative disorders under acids can also be used as hybridisation of probes, in chromosome mapphing, tissue typing, preventive medicine and probes, in chromosome mapphing, tissue typing, preventive medicine acids can also be used to be acid present invention.

A, Note: the sequence is almost identical with that of the B.coli phage K3
C, Comment: At the end of the growth cycle, phage T4 expresses two genes with lysis funct about the gene product of t, although it has been suggested that it acts as a phospholi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Residues: 1-334 <KUR>

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermia. Also expressed in the brain, mammary gland, cerbellum, spinal cord and kidney. Lower levels in salivary gland, uterus, thymus, thyroid, placenta, trachea and testis. Up-regulated in ovarian carcinoma, especially late-stage serous carcinoma, compared with normal ovaries and lebnign adenomas (at the protein level).
INDUCTION: By estrogens and glucocorticoids in a breast carcinoma
                            Dong Y., Kaushal A., Brattsand M., Nicklin J., Clements J.A.; "Differential splicing of KLKS and KLK7 in epithelial ovarian cancer produces novel variants with potential as cancer biomarkers.";

J. Bacteriol. 175:85-93(1993).
-!- FUNCTION: At the end of the growth cycle, phage T4 expresses two genes with lysis function, e and t. Nothing is known about the gene product of t, although it has been suggested that it acts as a phospholipase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-95280910; PubMed=7760808;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and mouse CDNA sequences.",

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-! FUNCTION: Absolutely required for simian virus 40 DNA replication in vitro. It participates in a very early step in intiation. RP-A is a single-stranded DNA-binding protein (By similarity).

-! SUBDINIT: Heterotrimer of 70, 32/30, and 14 kDa chains. The DNA-binding activity may reside exclusively on the 70 kDa subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GO; GO:000562; C:DNA replication factor A complex; TAS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBDATT: Heterodimer of a small subunit and a large subunit. Both participate in formation of the active center, but the ATP-binding site is exclusively located on the small subunit (By similarity). SIMILARITY: Belongs to the eukaryotic-type primase large subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Sequence 89, Application US/09502600A

Patent No. 6294344

GENERAL INFORMATION:

APPLICANT: O'Brien, Timothy J.

TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of TITLE OF INVENTION: Ovarian Cancer

TITLE OF INVENTION: Ovarian Cancer

TITLE OF INVENTION: Ovarian Cancer

FILE REFERENCE: D6232GIP-C

CURRENT FILING DATE: 2000-02-11

CURRENT APPLICATION NUMBER: 09/039,211

PRIOR FILING DATE: 03-14-1998

NUMBER OF SEQ ID NOS: 136

SEQ ID NO 89

LENOTH: 9

TYPE: PRT

CORGANISM: Homo sapiens

OTHER INFORMATION: Serine protease catalytic domain of stratum corn.
OTHER INFORMATION: chymotryptic enzyme (Scce) homologous to similar
OTHER INFORMATION: domain in TADG-12
GENERAL INFORMATION:

APPLICANT: O'Brien, Timothy J.

APPLICANT: O'Brien, Timothy J.

APPLICANT: O'Brien, Towell J.

TITLE OF INVENTION: No. 6442013el Extracellular Serine Protease

TITLE OF INVENTION: No. 6442013el Extracellular Serine Protease

CURRENT APPLICATION NUMBER: US/99/618,259

CURRENT APPLICATION NUMBER: US/99/618,259

FILING DATE: 2000-07-18

PRIOR FILING DATE: 1998-08-21

NUMBER OF SEQ ID NOS: 72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Sequence 1, Application US/09027337B

Patent No. 5972616

GENERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
APPLICANT: Tanimoto, Hirotoshi
TITLE OF INVENTION: Breast and Ovarian Carcinomas
FILE REPERENCE: D6064

CURRENT APPLICATION NUMBER: US/09/027,337B

CURRENT FILING DATE: 1998-02-20

NUMBER OF SEQ ID NOS: 13

SEQ ID NO 4

LENGTH: 225

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme.

Claim 25; Page 102; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

Sequence 9 AA;

```
The present invention relates to novel activated immune T cells or dendritic cells directed toward extracellular serine procease termed tumour antigen derived gene-14 (TADG-14). The method of the invention involves exposing the immune cells to a TADG-14 protein fragment, where exposure to the TADG-14 protein fragment activates the immune cells. The invention is used for the production of activated immune T cells or dendritic cells. The invention allows screening to identify proteases overexpressed in carcinoma. The present sequence is stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of activated immune cells or dendritic cells by exposing immune cells to tumor antigen derived gene protein fragment consisting of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       against stratum corneum chymotrytic enzyme (SCCE), comprising incollating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunocherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                   Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:32.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for vaccinating an individual

The invention relates to extracellular serine protease termed tumour antigen derived gene-14 (TADG-14) and its nucleic acid. Composition comprising TADG-14 peptide is useful for treating a neoplastic state in an individual. The neoplastic state is chosen from ovarian cancer, cancer, lung cancer, colon cancer, prostate cancer in which TADG-14 is overexpressed. The present sequence is Stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the envention.
                                                                                                                                                                                                                                                                           Novel isolated DNA encoding tumor antigen derived gene-14 protein, useful for treating neoplastic state (such as ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer) in an individual.
                                                                                                                                                                                                                                                                                                                                                    Example 1; SEQ ID NO 4; 46pp; English

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

# Claim 1; Page 172; 586pp; English.

The present invention describes NoVX proceins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide

CC described above and a carrier; (2) a kit comprising, in one or more

CC containers, the composition described above; (3) an isolated mucleic acid

CC comprising the nucleic acid molecule described above; (5) a cell

CC comprising the nucleic acid molecule described above; (5) a cell

CC comprising the bove vector; (6) an antibody that immunospecifically

CC comprising the above polypeptide or nucleic acid molecule in a

Sample; (8) methods for determining the presence of or predisposition to

CC sample; (8) methods for determining the presence of or predisposition to

CC a disease associated with altered levels of expression of the above

CC a disease associated with altered levels of expression of the polypeptide described

CC comprising a nagent that binds to the polypeptide described

CC method of identifying a potential therapeutic agent for

Use in treating a pathology that is related to an aberrant expression or

above; (10) a method for identifying a potential therapeutic agent for

CC above; (10) a method gor identifying a potential therapeutic agent for

CC a pathology associated with the polypeptide; (11) a method of

CC screening for a modulator of activity or of latency or predisposition to

CC a pathology associated with the polypeptide; (12) a method for modulating

CC or preventing a pathology associated with the above polypeptide. Novx

CC a pathology associated with the polypeptide in a

CC mammal; and (14) a method for producing the above polypeptide. Novx

CC sequences have antidiabetic, anorectic, antibacterial, virucide,

CC immunomodulator, cytostatic, noorropic, and above polypeptide in an antilipaemic activities, and can be used in gene therapy. The

CC polypeptide is useful in manufacturing a medicament for treating a

CC acid molecule map be used to diagnose, treat or prevent metabolic

CC disorders such as diabetes or obesity, infections, c

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abbrrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides. For example, NOVX polypeptides and current associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypeptides and complementary sequences may also be used as DNA probbs in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of capture to the production of antibodies and in assays to identify modulators to the production of antibodies and in assays to identify of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists and capturity of NOVX.

Colypeptides and polynucleotide expression and activity of NOVX polypeptides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, all the waithous dyslipidaemias, metabolic shorders, and the various dyslipidaemias, metabolic disorders, haematopoletic disorders, and the various dyslipidaemias, metabolic disorders, and the waith obesity, the metabolic syndrome X and

Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease

                                                                                                                                                                                                                                                                           The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protein or its fragments of 9-20 an individual against TADG-15, having, suspected of having or at risk of getting cancer. Purthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.

```
The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX by supplementing the patient our polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators canti-NOVX polypeptides and antagonists and antagonists may also be used to modulate NOVX polypuncleotide expression and activity of NOVX polypeptides antibodies, agonists and antagonists may also be used as attivity of NOVX polypeptides antibodies, agonists and antagonists may also be used as diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, ancer, and the various dyslipidaemias, metabolic disorders associated with obesity, the metabolic syndrome X and discusses, anorexia, cancer, cancer associated cachexia, metabolic cancer, and the various dyslipidaemias, metabolic disorders, and the various dyslipidaemias, metabolic wasting disorders associated with obesity, the metabolic syndrome X and chereting disorders associated with chronic diseases and various cancers.

They may also be used as antibacterial agents. The present sequence
                         diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslighdaemlas. The nuclèic acids can also be used as hybridiation probes, in chromsome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the

The present live forestibles Nova process.

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containmers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential described above; (11) a method of a method for identifying a potential therapeutic agent for abortant physiological interactions of the polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating cor preventing a pathology associated with the above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, mammal; and (14) a method for producing the above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manna disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypetides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymucleotide expression and activity of NOVX.

C polypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX c polypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious diagnose and creat, cancer, cancer-associated cachexia, neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;
